

**PRO DUTY®**

All Pro Duty pulleys feature profiled end discs similar to that found in high tension Turbine pulleys. Profiled end discs are shaped from a solid piece of steel allowing for the hub to be machined into it rather than welded in. Welded hubs are the most common failure point for drum pulleys, so reliability is increased dramatically with profiled end discs. In addition, bushing problems and shaft walking are reduced because loading stresses are distributed across a profiled end disc more efficiently.

**HEAVY DUTY DRUM PULLEY**

The toughest conveyor applications require ruggedness offered by a HDD. Steel rims, hubs and discs are fused into an integral component by a continuous submerged arc welded bond that maximizes pulley strength, balance and concentricity. The HDD is available with various hub and bushing systems.

**SPIRAL DRUM PULLEY**

The PPI Spiral Drum pulley is formed by a pair of vertical steel bars helically wound around a Heavy Duty Drum (HDD) pulley. This unique design is frequently used when additional cleaning action is desired without introducing additional belt vibration. Rotation of the pulley automatically starts the cleaning action by discharging foreign material to the side of the conveyor.

MINE DUTY DRUM PULLEY

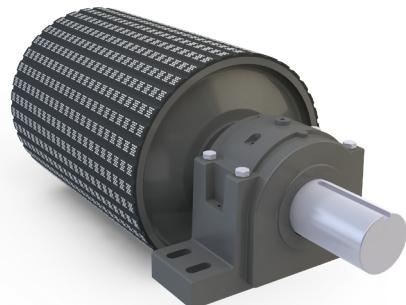

PPI Mine Duty Drum pulleys incorporate heavier rims and end discs for increased service life and safety factor. Suited for more demanding applications, such as frequent starts and stops with a loaded belt or where increased reliability is desired.

ENGINEERED CLASS DRUM PULLEY

PPI Engineered Class Pulleys are supplied with various hub and bushing systems including keyless locking devices which are common on high tension steel cable belt systems.

**EZ MOUNT PULLEY SYSTEM**

EZ mount is a unique pulley and shaft system that allows for fast and economical bearing and shaft replacement without removing the pulley from the conveyor. It reduces maintenance and replacement time by using rugged engineered stub shafts. The exclusive PPI EZ Mount Pulley and shaft system are manufactured to CEMA standards and Mine Duty specifications.

**TURBINE PULLEY**

Today's efficient high tonnage mines demand dependable long life components. Using state of the art engineering and design techniques, such as Precision Finite Element Analysis, PPI meets these needs by controlling material stress points. Incorporating all of the benefits of PPI's proven experience in heavy mining pulleys, the turbine offers our customers world class performance and reliability.

LAGGING FOR DRUM CONVEYOR PULLEYS

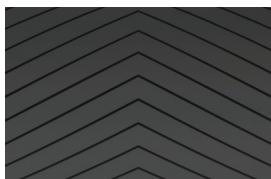

PPI has complete in-house pulley lagging capabilities. Every step of the pulley manufacturing and lagging process is controlled internally, which assures quality, prompt delivery and competitive pricing of lagged pulleys. Available in a wide variety of styles and thicknesses, lagging is primarily used to improve traction capacity, resist abrasive conditions and extend pulley and belt life. The style of lagging required is usually influenced by operating conditions. While the standard is 60 durometer, it is available in various durometers, with 45 and 70 being the common alternates. SBR is standard; Neoprene and MSHA are available as well as a wide variety of other compounds.

Other lagging is available for specific applications. An example of this is roughtop lagging. This is used for small diameter drive pulleys. It is created by lagging the pulley, but before the rubber is cured, a special mold is applied to cause the grooves to be formed in the lagging. It is then cured with this form in place. It gives excellent traction, without cutting grooves. By forming the groove in the lagging, PPI can offer roughtop on thin lagging , such as 1/4". Consult the factory for your specific requirements.

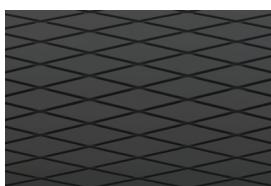

HERRINGBONE GROOVE LAGGING (HBG)

The style of lagging required is usually influenced by operating conditions. This style grooving is where the points do not meet in the middle. This is normally used in drive pulleys, with the V pointing in the direction of rotation. (3/8" minimum thickness)

CHEVRON GROOVE LAGGING (CHE)

Some prefer having the points meet, as done in Chevron. This is also used primarily on drive pulleys. (3/8" minimum thickness)

DIAMOND GROOVE LAGGING (DIA)

Diamond, or double HBG, or double chevron is primarily used for reversing conveyor drive pulleys. It is also often used for spare pulleys when one doesn't know the direction of rotation. (3/8" minimum thickness)

CIRCUMFERENTIAL GROOVE LAGGING (CIR)

This is used on non drive pulleys in very wet applications or cold temperatures. It allows the lagging to deflect, keeping material from building up on the lagging. (3/8" minimum thickness)

ALIGNER GROOVE LAGGING (LOR)

This is a Lorig style lagging. Lorig is used on flat face pulleys, the lagging is machined flat, then grooves are machined in at an angle. This results in a training action. As the rubber is compressed by the belt, the lagging will deflect towards the center, helping to track the belt. (3/4" normal thickness)

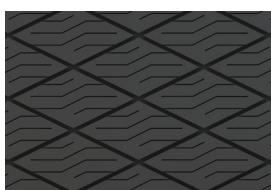

CERAMIC LAGGING

Ceramic lagging is ceramic tiles molded into a rubber compound. This makes for excellent traction, reducing slippage and offering excellent abrasion resistance.

VULCANIZED ENGINEERED CERAMIC LAGGING (VEC)

Our patented VEC lagging starts with SBR or Neoprene lagging that is hot vulcanized on a pulley. Our uniquely designed tiles are then embedded in the vulcanized lagging. This design eliminates seams, where failures often start. This process allows flexibility in tile coverage and grooving patterns.

CRAFT-LAG®

Craft-Lag is bonded to rigid backing, which is then formed to a specific diameter. Craft-Lag can be used with or without retainers and is ideal for mining, crushed stone, sand and gravel, cement, agriculture, food processing, coal mining, power plants, feed and grain, and general industry.

- * Requires a stamp for MSHA approval.
- Use a flame resistant lagging in all grain or underground applications.

- Use a static conductive lagging in all applications with grain or material containing explosive dust.
- FDA approved for food grade application.

XT® HUBS & BUSHINGS

XT® Hubs & Bushings were computer-designed and specifically developed for conveyor pulley applications. This design utilizes a tapered bore bushing that provides all the holding power you'll ever need for conveyor pulleys and allows easier installation and removal than other bushing types

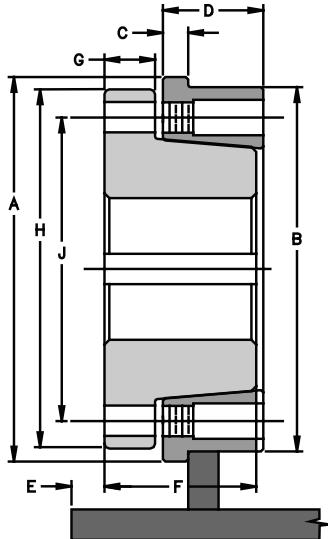

- Designed for conveyor pulley applications
- 2" per foot taper
- Self-seating – no need to hammer bushing in
- Less axial movement – reduces end disc stress and seats quicker
- High clamping force eliminates need for keyway on non-drives
- Bolts equally spaced for even draw-up
- More material in the barrel
- Full length hub engagement
- Flange deflection stores up capscrew torque for seating while running
- Easy removal
- Full size keys in max bores for size 50 and larger

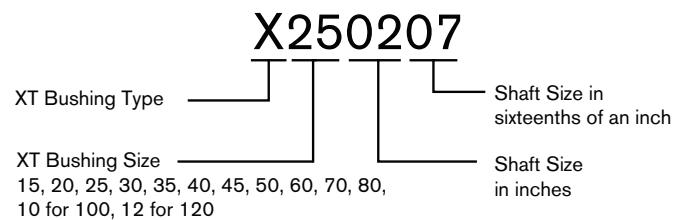

PPI offers the XT® with larger hub diameters and longer hubs for greater load capacity.

PPI has found that the XT® taper and heavy barrel are best suited to our design philosophy and recommends them for pulley hub usages. For metric key sizes, please see our website at www.ppi-global.com, just click on Resources, then Catalog/Product Sheets and scroll down to XT® Charts.

QD® HUBS & BUSHINGS

QD® has a primary benefit of bushing interchangeability with other shaft mounted components. Its shallow taper provides a high mechanical advantage to assure dependable clamping to the shaft.

- Designed for a wide variety of applications
- 3/4" per foot taper - self-seating
- High clamping force eliminates need for keyway on non-drives
- Flange deflection stores up capscrew torque for seating while running

KEYLESS LOCKING ASSEMBLIES

The standard in keyless locking assemblies is the RBL, it is self-centering, and no pilot bushing is needed. The single taper design is better able to handle the bending moment present in pulley applications. For high-tension applications, Precision Pulley & Idler recommends the RBM and the RBH. The graphic shows the relative difference in size and bending moment for each series.

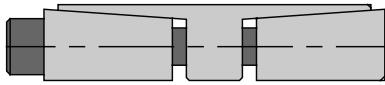

The chart to the right gives a range of standard sizes and the relative torque ratings. This is a representation of the sizes that are commonly available. Nominal inch as well as metric sizes are also available for shaft sizes under 8 inch. For special applications, PPI works with the vendor to engineer an appropriate locking assembly designed just for that application.

RBL
(BENDING RATING 104)

RBM
(BENDING RATING 197)

RBH
(BENDING RATING 280)

LOCKING ASSEMBLY	ALLOWABLE BENDING MOMENT
RBL	28%
RBH	32%
RBH	35%

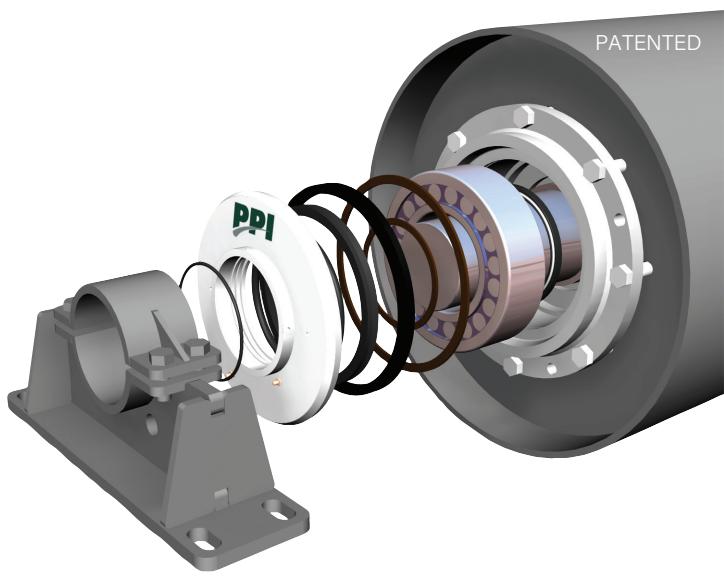

- Allowable bending moment as a percentage of torque rating of the locking assembly.
- Shaft diameters below 8 inch are usually available in nominal inch sizes.
- This is a partial list of available series and sizes.

- Static shaft for increased reliability
- Standard spherical bearing
- Self-aligning bearing transfers load to the shaft
- Self-aligning bearing does not transfer bending load into the pulley
- Reduces bending stress on critical weld joints
- Bearing is protected by dual contact seals
- Stationary grease fittings
- Maintenance friendly hub bolts with back-out holes
- Welded steel mounting blocks
- Standard mounting pattern for drop-in replacement
- Available in various pulley styles for non-drive, non-brake, non-backstop pulley locations
- For other sizes and styles contact your local PPI Representative

SIZE	BORE	SIZE	BORE
15	2.953	34	6.693
20	3.937	36	7.087
22	4.331	38	7.48
24	4.724	44	8.661
26	5.118	48	9.449
28	5.512	52	10.236
30	5.906	56	11.024
32	6.299	60	11.811

PPI offers several other styles to fit your particular needs. These include, but are not limited to, Press Fit (interference fit with keyway), Fixed Bore (solid bore, clearance fit with keyway and setscrews), and Weld-in (no hub, welded to the shaft). For more information on these and other means of attaching a pulley to a shaft, contact your local PPI representative.

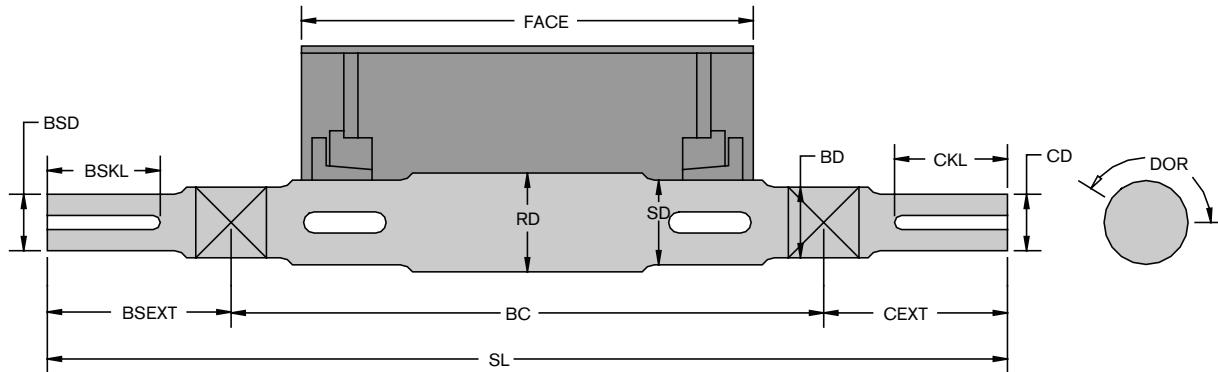

SHAFTING & SHAFT ORDERING DETAIL

PPI conveyor pulley shafting is a vital part of the total pulley assembly. Standard PPI shafting is AISI 1045, which represents the higher carbon range in the open hearth carbon group. Excluding alloy steel, higher carbon content in a AISI 1045 results in one of the strongest steels in the carbon range and machines to a smooth finish. Normally, PPI uses T&P for shafting up through 5-15/16 inches. While, hot rolled and/or forged shafting (depending upon size, availability, and specifications) is used above a 6 inch diameter.

Other materials, including 1018 (used for welding compatibility), 4140, and 4340 (normally used for high stressed areas, such as drive extensions) are available upon request.

Shafting can be keyed or journaled to meet any specification.

PPI shafting capabilities cover the broad spectrum of our customers, from unit handling to some of the largest pulley shafts in the world, PPI can handle your needs.

PULLEY ID	IDENTIFICATION					
QTY	Quantity					
OD	Outside Diameter without lagging

BSKW	Key Size					
DOR	Direction of Rotation					

1. **Determine effective tension that is supplied by the motor.** $T_e = HP * 33,000 / FPM$.
2. **Determine slack side tension.** Using the K-factor from Table 1, multiply the effective tension (T_e) by K to determine the slack side tension $T_2 = T_e \times K$.

This is the minimum T_2 tension. You may have to add an additional safety factor depending upon your application or how you tension your belt, i.e. wire rope/screw/etc.
3. **Determine T_1 or tight side tension.**
 $T_1 = T_2 + T_e$
(for dual drives, add the primary T_e to the intermediate tension).
4. **Determine the angle of wrap for each pulley.**
If unknown, use 180 for tail, take-up, and un-snubbed drives. Use 210 for snubbed drives, 30 for snubs and 90 + the incline angle for bend pulleys.
5. **To determine the resultant load** on non-drive pulleys, multiply the belt tension at that pulley by the resultant load factor in Table 2 for that pulley wrap. Then $R = T_2 \times \text{Factor}$.
6. **For Drive pulleys, divide the T_1 by T_2 .** Use this ratio and Table 4 to determine the drive pulley resultant load factor. Then $R = T_2 \times \text{Factor}$
7. **Determine Face Width.** For belts up through 42 inches add 2 inches to the belt width. For belts 48-60 add a minimum of 3 inches to the belt width.
8. **Determine the shaft size** by using Table 5 or Table 6. Subtract the face width from the bearing centers ($BC - F$). Follow the proper pulley face width column and across from the bearing center minus face value (interpolate if correct amount is not listed) until the load rating is greater than the resultant load determined above. Follow this procedure for each pulley.
9. **For pulley diameters, check with your belt manufacturer.** The belt requirements are the single largest consideration when choosing a pulley diameter.
10. **Divide the tension at each pulley by the belt width to get the PIW for each pulley,** (for the drive use T_1) and check this against Table 3, XPD & MDD. If the PIW exceeds the rating for a XPD consider the MDD or increase the diameter. If this results in a pulley that does not fit into your conveyor, please contact PPI Engineering.

Pulley Type Hub Type & Size
 XPD - Drum Pulley Face Width
 MDD - Mine Duty Drum Standard are:
 XPW - Wing 06 to 46 by 2 inch increments
 MDW - Mine Duty Wing 51 to 66 by 3 inch increments
 QMW - Quarry Max Wing Pulley OD Standards are:
 XPS - Elevator (Single Disc) 04 to 06 by 1 inch increments
 XPU - Unit (formed crown tube) 08 to 20 by 2 inch increments
 XPT - Tube (machine crown) 24 to 60 by 6 inch increments

X250207

XT Bushing Type Shaft Size in sixteenths of an inch
 XT Bushing Size Shaft Size in inches
 15, 20, 25, 30, 35, 40, 45, 50, 60, 70, 80,
 10 for 100, 12 for 120

QSF0207

QD Bushing Type Shaft Size in sixteenths of an inch
 QD Bushing Size Shaft size in inches
 SF, E, F, JS, MS, NS, PS, WS, SS, ZS

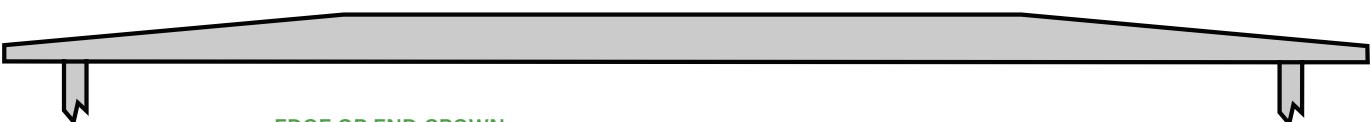

STANDARD CROWN FACE

PPI's standard face style is a full crown where the OD increases by 1/8" per foot from the edge to the center of the pulley.

HIGH CROWN

Used on narrow face widths such as elevator pulleys. The crown extends across the entire pulley face similar to standard crown, however the crown rate is 50% to 100% more for better belt tracking.

EDGE OR END CROWN

This is a partial crown, commonly used on tube pulleys. The pulley crown is machined only on the edges at the standard crown rate. The center of the pulley is left unmachined.

TRAP OR TRAPEZOIDAL CROWN

This is a partial crown, also used on tube pulleys. However, the entire face of the pulley is machined for better TIR throughout before crowning the ends at the standard crown rate.

CONVEYOR PULLEYS

Working Together So Pulleys Are Designed Correctly For Your Applications

ENGINEERED TO MATCH YOUR APPLICATION

BENEFITS

- » Pulley specific engineers with conveyor design experience limit misapplications
- » Submerged arc welds are stronger and more precise
- » Broad range of classes, styles and sizes
- » Three North American and three Brazilian plants
- » In-House vulcanization improves quality and lead times

SPECIFICATIONS

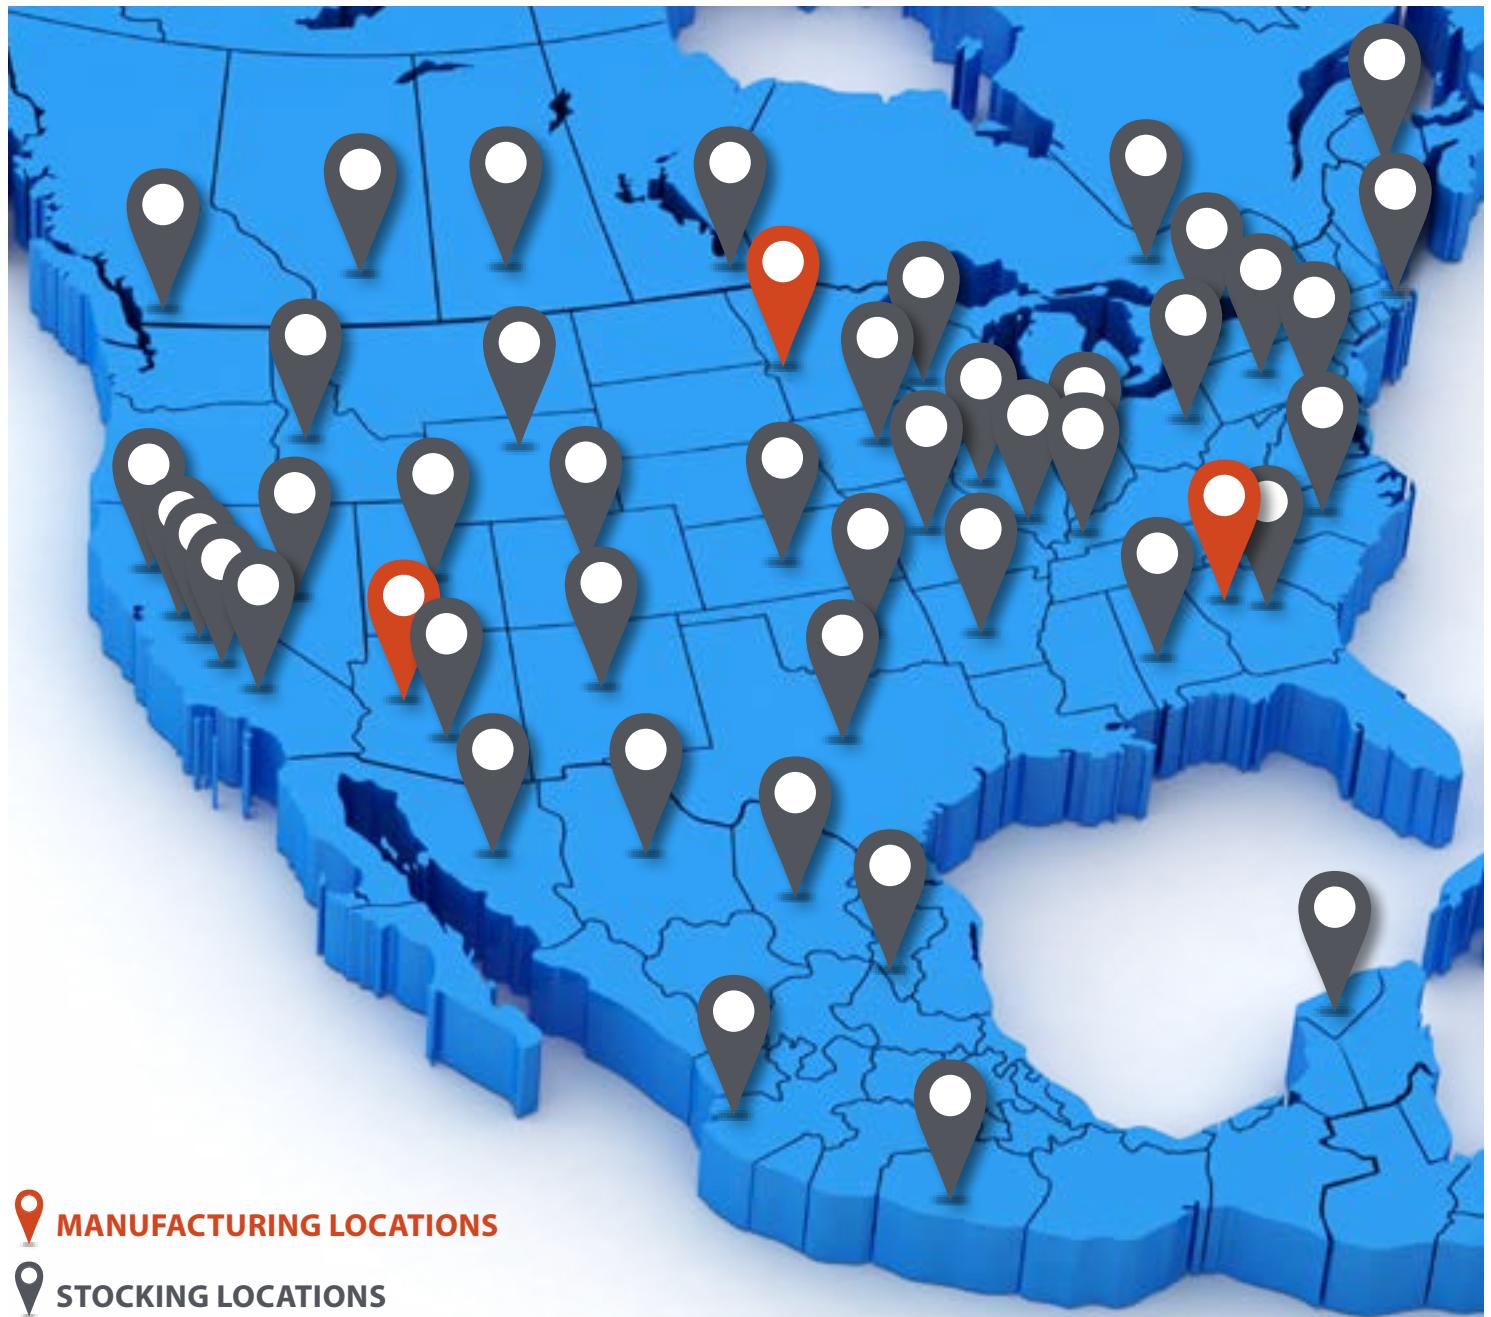

- » Classes: CEMA, Mine Duty, Super Duty and Engineered
- » Diameters: 4" - 98" (101mm - 2,500mm)
- » Face Widths: 12" - 102" (304mm - 2,590mm)
- » Shafting: Up to 23" (585 mm)

SPECIFICATIONS

CONVEYOR PULLEYS				
Pulley Types	Pulley Diameter inch (mm)	Integral Hub Diameter inch (mm)	Face Width inch (mm)	Contact Bar Thickness inch (mm)
CEMA Duty Drum Pulley	4"- 60"(101 - 1,524)	12"(304) and under	12"- 78"(304 - 1,981)	—
CEMA Duty Wing Pulley	6"- 60"(152 - 1,524)	—	12"- 78"(304 - 1,981)	1/4"x 1-1/2" min., 3/8"x 1-1/2", 5/8"x 1-1/2"
Mine Duty 1.5 Drum Pulley	8"- 60"(203 - 1,524)	12"(304) and under	12"- 78"(304 - 1,981)	—
Mine Duty 2.0 Drum Pulley	8"- 60"(203 - 1,524)	12"(304) and under	12"- 102"(304 - 2,590)	—
Mine Duty 2.0 Wing Pulley	8"- 60"(203 - 1,524)	—	12"- 78"(304 - 1,981)	5/8"x 1-1/2" min. (15 x 38)
Super Duty Drum Pulley	10"- 60"(254 - 1,524)	12"(304) and under	12"- 102"(304 - 2,590)	—
Super Duty Wing Pulley	10"- 60"(254 - 1,524)	—	12"- 78"(304 - 1,981)	3/4"x 2" min. (19 x 50)
CEMA Duty Chevron® Pulley	8"- 36"(203 - 914)	Up to 24"(610)	12"- 78"(304 - 1,981)	1"x 1/2" half round bar (38)
Mine Duty Chevron® Pulley	12"- 48"(304 - 1,219)	Varies	12"- 78"(304 - 1,981)	1" round bar (25)
Super Duty Chevron® Pulley	12"- 48"(304 - 1,219)	Varies	12"- 78"(304 - 1,981)	1-1/2" round bar (38)

DESIGN CLASSES

	CEMA Duty	Mine Duty 1.5	Mine Duty 2.0	Super Duty	Core Systems® Design
Wing Pulleys		—			—
Drum Pulleys					
Chevron® Pulley		—			—
Design Standards	Load, dimensions and crown defined by ANSI B105.1	Roughly 1.5X service factor of CEMA standard	Roughly 2.0X service factor of CEMA standard	Exceeds 2.0X service factor of CEMA standard	Custom Engineered Class
Conveyor Type	Light duty, portable	Medium duty	Heavy duty	Extra heavy duty	High tonnage
Belt Style	Fabric	Fabric	Fabric	Fabric	Steel cable or fabric
Belt Burden	Not started under load	Started under moderate load	Started under full load	Started under full load	Started under full load
Starts and Stops	Infrequent	Moderate	Frequent	Frequent	Frequent
Feed Characteristics	Uniformly loaded	Uniformly loaded	Non-uniformly loaded	Non-uniformly loaded	Non-uniformly loaded

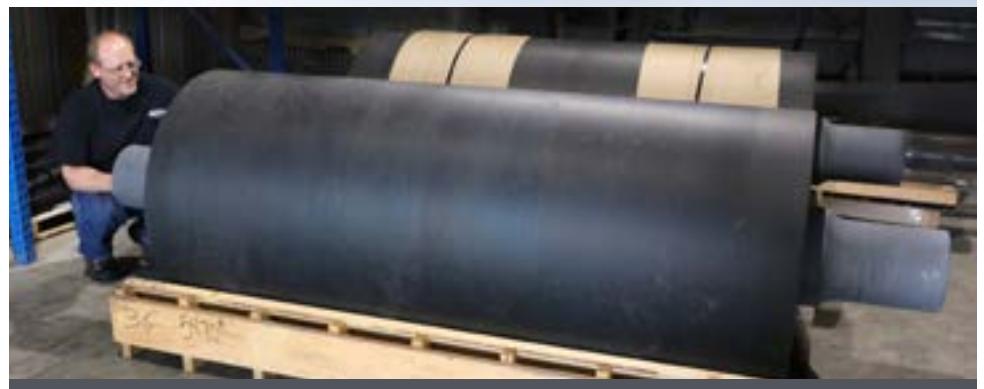

MANUFACTURING LOCATIONS

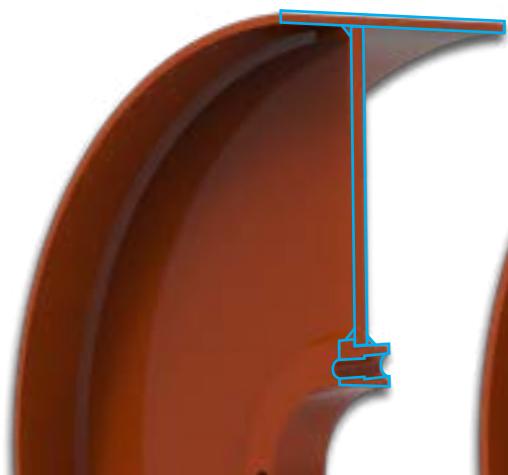

STOCKING LOCATIONS

SUBARC > STANDARD ARC

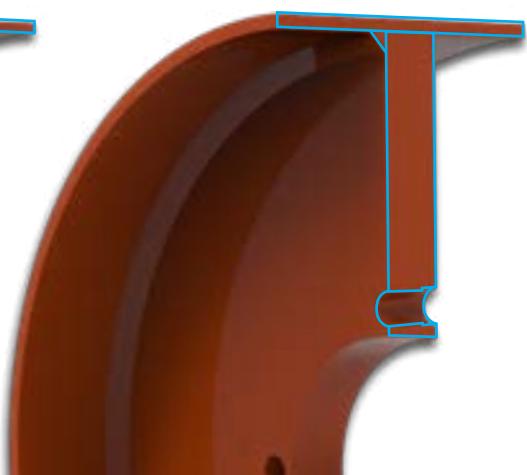

HEAVIEST CONSTRUCTION IN THE MARKET

CLASS ONE

WELDED HUB

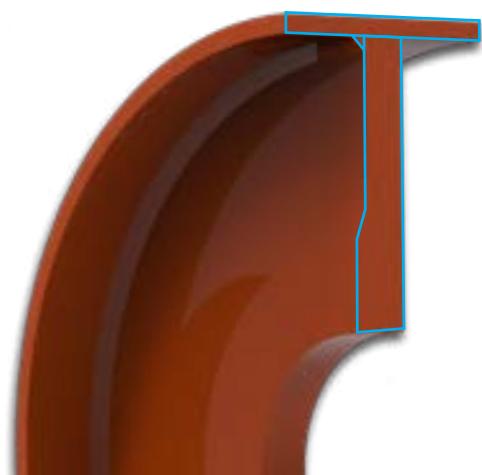

- » Standard
- » Best value
- » Applications without high tension

CLASS TWO

INTEGRAL HUB

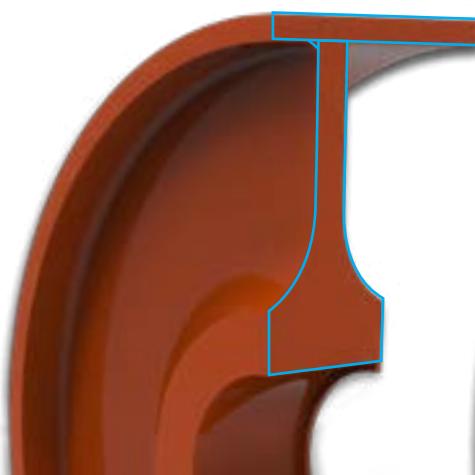

- » 12" (305 mm) diameter and less
- » Eliminates hub to end disc welds
- » Optimized for XT bushings

CLASS THREE

PROFILE DISC

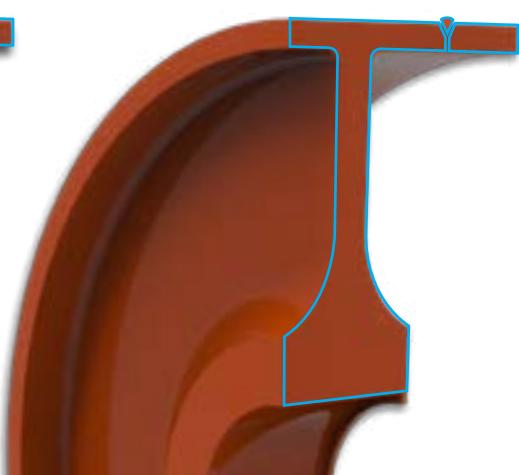

- » Solid profiled end disc
- » Eliminates hub to end disc welds
- » Designed for keyless locking device

CLASS FOUR

TURBINE END DISC

- » One piece, solid end disc
- » Machined on both sides
- » Typically steel cable applications

CLASS FIVE

T-SECTION

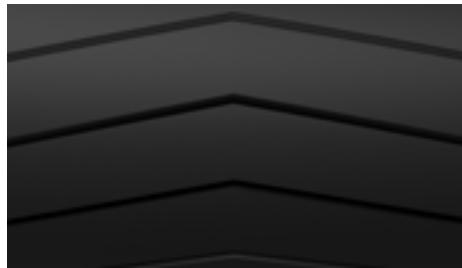

- » No weld at end disc
- » Weld at rim, lowest stress point
- » Withstands highest tensions

LAGGING OPTIONS

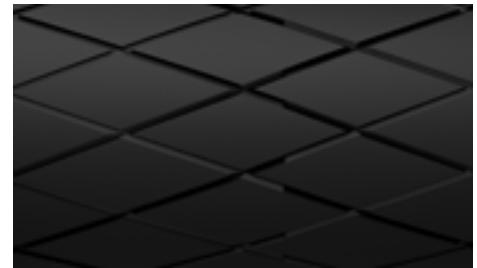

HERRINGBONE

- » Drive pulley applications
- » 3/8"(10mm) minimum thickness

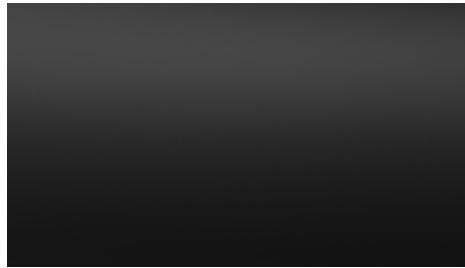

CHEVRON

- » Drive pulley applications
- » 3/8"(10mm) minimum thickness

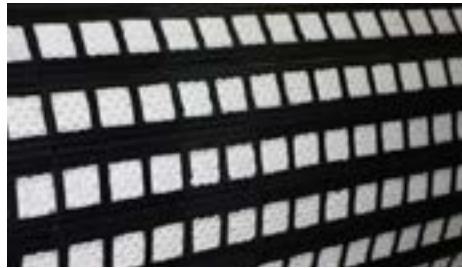

DIAMOND

- » Bidirectional applications
- » 3/8"(10mm) minimum thickness

SMOOTH

- » Snub and bend pulley applications
- » 3/8"(10mm) minimum thickness

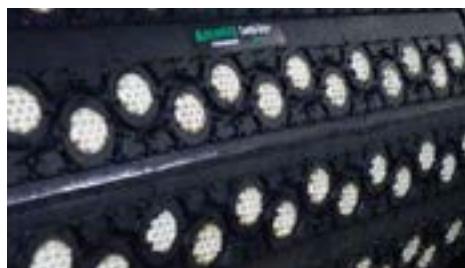

RICHWOOD COMBI-LAGG®

- » 5% more grip than other tiles
- » 2X friction of standard lagging
- » 5/8"(16mm) minimum thickness

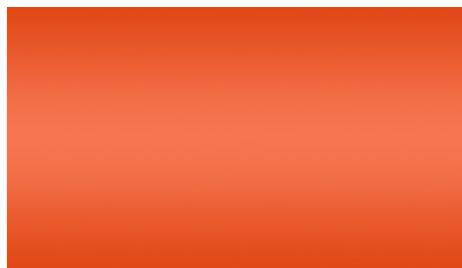

RICHWOOD REDI-LAGG™

- » Weld-On pulley lagging
- » Same technology as Combi-Lagg
- » 1/2"(13mm) minimum thickness

RICHWOOD COMBI-GRIP

- » Pulleys up to 475 PIW
- » Water shedding grooves
- » 5/8"(16mm) thickness

URETHANE

- » Abrasion resistance
- » Chemical resistance
- » Less water absorption than rubber

OTHER OPTIONS

- » Abrasion resistant rubber
- » Oil resistant neoprene rubber
- » Anti-static, fire retardant MSHA rubber
- » Custom durometers (60 is standard)
